

Rack Mount/Table Top THC Analyzer TVOC Heated FID VE 7

The VE7 19"/5PU rack mount and table top heated emission analyzer for the continuous determination of the mass concentration of total gaseous organic carbon using the Flame Ionization Detector Method.

Throughout the EU the VE7 complies with QAL1 (EN 14181-EN ISO 14659), with EN 12619:2013 and in USA with EPA Method 25A and Method 503

**Low cost of ownership. **Low fuel gas consumption. **The combustion air supply for the FID-detector is built in. No external cylinder for synthetic air is needed. **To prevent well known HC hang up (memory effect) and related drifting,the heated sample line can easily be connected inside of the heated oven. This prevents any cold spot and any related HC condensation.

General:

Confirmed by TÜV-Nord (Germany) to comply with EN 14181 and EN ISO 14956U). Complies with EN 12619:2013 (EU) and US-EPA Method 25A and Method 503 (USA)

With many thousand's of units sold, the VE7 is our mostly distributed, most robust and cost effective heated FID analyzer in source and stack testing worldwide

The J.U.M. Engineering HFID Model VE7 is time proven in an over 40 years. It is a highly reliable and outstandingly rugged 19" rack mount or table top heated total hydrocarbon (total gaseous organic carbon) analyzer. Built for very low drift, high accuracy, sensitivity and stability. The VE7 uses a hydrogen flame ionization detector (FID) in a heated oven to prevent the loss of high molecular weight hydrocarbons and to provide reliable performance in the analysis of high concentrations down to very low trace concentration levels of gaseous organic carbon contaminants in emissions, air and other gases and high purity gases.

All sample containing parts and components are discretely integrated into the heated chamber. The permanent heated sample filter is cleaned by back purging with compressed air or nitrogen. This allows uninterrupted measurements during cleaning the sample filter. While back purging the sample filter, the external sample line and sample probe is also cleaned. The use of a stack probe filter is not necessary when the FID is used in a stand alone mode.

The combustion air supply for the detector is built in. No expensive zero gas generator or external cylinder for synthetic air is needed. The proprietary rear panel sample line adapter-plate system allows cold-spot free coupling of a heated sample line inside of the heated oven without the need of special tools. The fittings can easily be accessed through a wrench port in the right side panel.

Standard analyzer is optimized to comply with EN-12619:2013 specifications. Several target optimizations for non EN-12619:2013 applications available.

Analyzer Features

- 1. Made in Germany
- 2. <u>1st Sampling Choice</u>: Maintenance free, permanently installed sample filter back purge system allows filter to be cleaned without dismantling (automatic back purge optional)
- 3. <u>2nd Sampling Choice</u>: Disposable sample filter which is easily accessible in the rear panel without special tools. This optional available feature is an approx. <u>This reflects a 20% price advantage</u>.
- 4. All components in contact with sample are fully heated and digitally maintained at 190°C
- 5. Built-In sample pump
- 6. Built-in combustion air supply, no extra burner air bottle needed
- 7. Permanent 2 micron stainless mesh sample filter or 2 micron disposable sample filter
- 8. "Overflow" calibration system for safe zero and span calibration
- 9. Automatic flame out alarm contact and optional available fuel shut off valve
- 10. Fast response less than 1 second @ sample inlet
- 11.Low fuel consumption @ 100% or 40/60 mixed fuel gases
- 12. Microprocessor PID type temperature controller
- 13. Cold spot free coupling of a heated sample line inside the heated oven with optional Adapter Plate (Works not with OVE Option)
- 14. Remote control for sample, zero gas, span gas and back purge is standard
- 15. Automatic or remote range change optional

Applications

- 1. Compliance monitoring of source hydrocarbons following European EN 14181/ EN ISO 14659, EN 12619:2013 regulations and USA EPA Method 25A
- 2. Stack gas hydrocarbon emissions monitoring
- 3. Fence line (perimeter) monitoring
- 4. Solvent recovery monitor for carbon bed break through
- 5. Catalytic converter and thermal combustion testing
- 6. Carbon adsorption regeneration control
- 7. Measuring engine combustion efficiency
- 8. Raw exhaust vehicle emissions analysis
- 9. Hydrocarbon contamination monitoring in air and other gases
- 10.Detection of trace hydrocarbons in purity gases used in the semi conductor industry
- 11.LEL monitor of solvent laden air

Principle of Operation

The Heated Flame Ionization Detection (HFID) method is used to determine the presence of total hydrocarbon concentrations in gaseous samples. Burning hydrocarbon-free hydrogen in hydrocarbon-free air produces a negligible number of ions in the detector. Once a sample which contains any organic carbon matter is introduced into this flame, a very complex ionization process is started. This process creates a large number of ions. A high polarizing voltage is applied between the two electrodes around the burner nozzle and produces an electrostatic field. Now negative carbon ions migrate to the collector electrode and positive hydrogen ions migrate to the high voltage electrode. The so generated ionization current between the two electrodes is directly proportional to the hydrocarbon concentration in the sample that is burned by the flame. This signal is measured and amplified by a highly sensitive and stable electro-meter-amplifier unit. Our proprietary sample pressure regulator provides a controlled sample pressure and flow which gives admittance of a constant sample flow rate to the FID burner. This technique of using our non sample contact regulator is time proven for over 40 years by J.U.M. Engineering to provide the highest possible sample low flow rate stability at the lowest maintenance. Our compactly designed flow control module for fuel, ignition and air flow rates via low thermal mass needle valves use high precision pressure regulators. The needle valves are factory adjusted and sealed to ensure the optimization of the burner.
